Estimated Costs Associated with Proposed Activities

After selecting alternative sites (number one above), of the approximate 13,220 acres (43.8 km²) required in supporting the proposed activities, approximately 10,255 acres (78%) will require wildlife surveys. In addition, approximately 6,919 acres of the 10,255 acres (approximately 52% of the total area) will require additional biological surveys which may include: presence and distribution of noxious weeds and other invasive plant species, identifying strategic locations of wash stations; habitat analysis and assessment, ranking of habitat based on integrity (i.e., disturbed to pristine); erosion potential, soil analysis and ground cover; and/or land sustainability assessments. Remediation should be recognized for at least 6,919 acres.
